

Creating Coverage Areas with Navionics+ or Navionics Updates

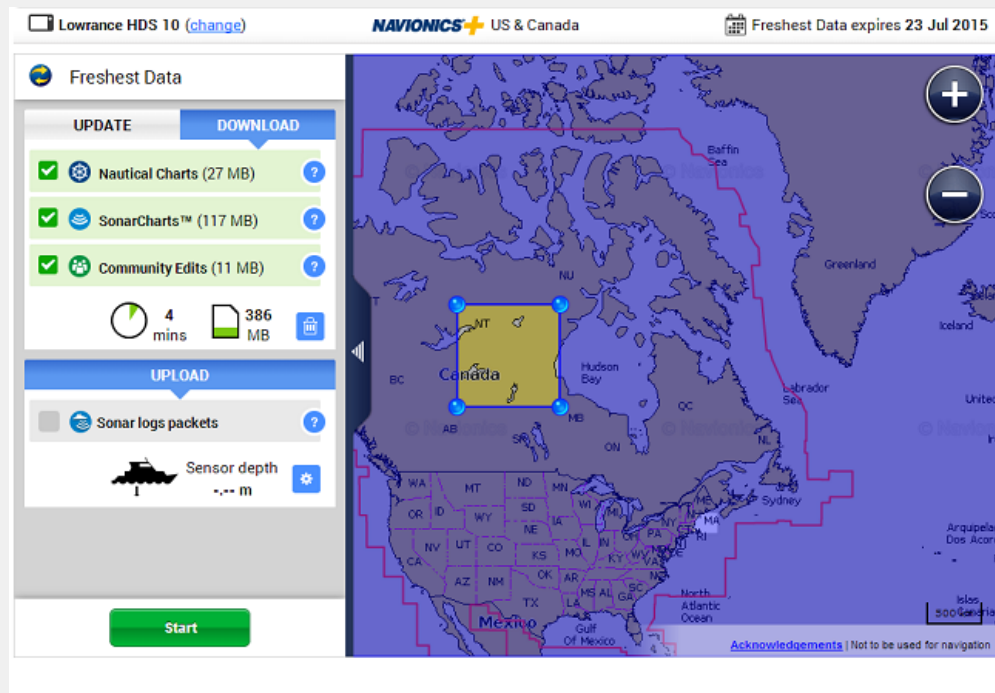

Details

Coverage areas can be downloaded to the Navionics+ and Navionics Updates cards, as well as cards that have been updated through our online Chart Installer to Navionics+. SonarChart™ and Community Edit layers can be added in the same way to Navionics+ and Navionics Updates preloaded cards.

1. Plug your Navionics card into your computer and launch the Chart Installer program.
2. The **UPDATE** tab will be highlighted. Select the **DOWNLOAD** tab.

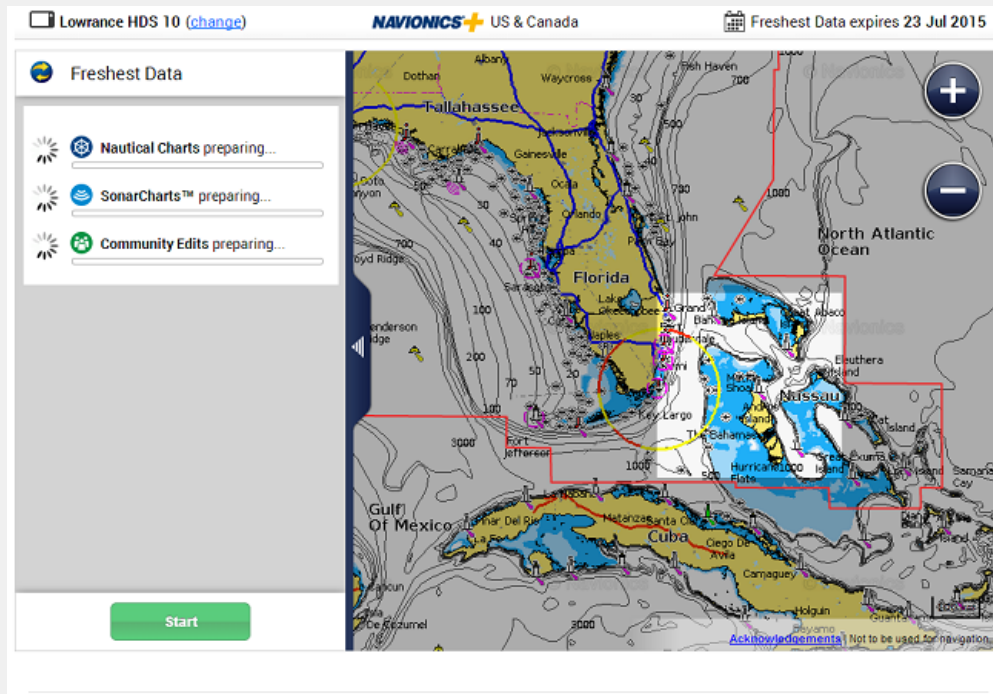

3. You will notice a highlighted box that is brighter than the rest of the map. This is your selection box and it is usually located in your general geographic area.

- . Click on a corner of this box and drag it over to your desired area. Zoom the map in to your desired lake/river/coastal area. Readjust the coverage box and hit “Start”.

Note: You may have to adjust the coverage box – then zoom the map in or out – readjust the coverage box – zoom in or out some more to select your desired coverage.

For Navionics+ or Navionics Updates preloaded cards, you can also [purge the preloaded coverage](#) from the card and download only the areas needed within your coverage area. This will remove all the preloaded chart data associated with your card, which can only be downloaded back to the card manually using the steps above.
